

# Project Profile

Private Residence Steamboat Springs 2025 | Steamboat Springs, CO

*The Steamboat Springs Residence is a high-end, new construction home designed to combine luxury living with long-term performance and durability. For this project, SlopeShield Plus Self-Adhered was chosen to protect the roof assembly during construction and provide lasting resilience once the roof is complete.*

*Installed over the roof substrate, SlopeShield Plus SA functions as a vapor permeable roof underlayment, offering temporary weather protection while keeping the roof dry during installation and throughout construction. Its durability and adhesion ensure the membrane performs even in challenging weather conditions, safeguarding the structure beneath and supporting the integrity of the overall roof system.*

*By protecting the roof assembly from moisture infiltration and potential damage, SlopeShield Plus SA contributes to a healthy indoor environment, helping preserve the materials and finish quality of this high-end residential home. Its proven performance provides builders and owners confidence that the residence will remain durable, protected, and comfortable for years to come.*
